with an emotion which, though wholly unlike our humanitarian attitude, finds expression in exaggerated praises. These can be understood only in relation to their immense importance in the social organization.

Lovedu cattle are a blend, it is said, of four different strains: the large, humped Lovedu with backward-curving horns, the small, sturdy long-horned Rhodesian, the small Swazi with incurving horns, and the recent, rather nondescript European breeds. In the present environment the mixture has led to inferior scrub cattle, resistent to tick-borne diseases and hardened by the stony hills. There are more cattle to-day than formerly and the distribution is far more equal, but no one believes that dipping has contributed to this result; on the contrary, dipping is regarded as a device to keep down their numbers, to subject the Native to irritating interference, behind which there are sinister motives. Recent attempts by the Administration to improve the breed by introducing thoroughbred Afrikander bulls failed because of these suspicions; the bulls were neglected and no camp was provided for them, and eventually they had to be removed. Cattle of individual owners are listed on so-called cattle lists, which primarily serve as a check upon the efficiency of the dipping; but the lists do not reflect real ownership, for they contain the cattle in a man's kraal, most of which may be merely in his care (*hu fisa*). These lists have considerably altered the incidents of the *hu fisa* contract and other aspects of Native life: they are often illegitimately used as evidence of ownership; orders of Native courts involving payments of cattle are sometimes nullified by the refusal of the owner of the list to authorize the transfer of cattle from his list to that of another; dipping and grazing fees imposed in some parts induce men, on the one hand, to distribute their cattle among different owners so as to keep down the number on any single list and, on the other, to make a charge, unauthorized by custom, for caring for the cattle of others. In short, European intervention has produced as serious changes in pastoral as in agricultural activities. Yet fundamentally the changes have left untouched the real significance and role of cattle in the society.

Cattle are not subject to as many taboos as elsewhere in Southern Africa. Women do not usually herd cattle, but the reason given is that not long ago the dangers from raids and wild animals necessitated herding by armed men; it was regarded as a purely practical measure. Girls or women may herd when the boys are in the circumcision school, and sometimes to-day young girls who have no brothers are seen looking after the cattle. What women may do or may not do varies almost from one kraal to another. Sometimes women of any age may go into the kraals; sometimes the doctor has protected the kraal in such a way that certain classes of women (not necessarily young women) are excluded. There is a fairly uniform fear that the blood of women or a woman who has had an abortion might cause the cattle harm. But the measures to combat these dangers vary very considerably. Kraals are doctored rather than cattle; and they are protected against various dangers, one of them being the danger of women. But elaborate magical practices, elsewhere associated with increasing the fertility of the cattle or safeguarding them

231 against misfortune and disease, are not necessary when a new kraal is
784 built or when the medicated pegs are hammered around the fence as a
789 protection against witches. Some confine their doctoring to the kraals; others, in addition, give the cattle medicine. Bulls are never magically rendered more virile, nor are cows made more attractive by such means. There are to-day hardly any special cattle doctors, and very few cattle diseases are known or subjected to treatment. This is not the result of the breakdown of the cattle cult; it is evidence of the weakness of the cult among the Lovedu. If one were to detail all the magical practices that are to be found, the volume of which would be doubly formidable owing to their diversity, an overwhelming impression might be given; but in true perspective, regarding them against the total background they are almost too insignificant to be noticed.

231 Far more important from every point of view is the adjustment that
●232 Natives are making to modern conditions. On this point we can offer
177 merely a few very general suggestions. Foremost is the problem of better co-operation between the Natives and the Administration. The objections to dipping are a symptom of misunderstanding one another's point of view. The Natives regard the restrictions as a punitive and arbitrary imposition. It is useless merely to urge that, by destroying the ticks that cause cattle diseases, dipping promotes both the increase and the welfare of the cattle. No one believes what is regarded as demonstrably false. Any one can see that cattle often die when they come back from the dip; that the rate of calving has decreased, that there are now no milch cows, that stock have degenerated, and so on. These evils are attributed to dipping, not to the hard driving to the dip, poor grazing, and inadequate care. What is more, it is believed that Europeans do not dip and that tribes that are sufficiently cunning escape the dipping regulations. Not a few advance the theory that dipping is a punishment for attachment to and preservation of old customs—surely an ironical comment upon the execution of a policy that aims at segregation and development on the lines of racial genius. The psychological aspects of these problems are no less important than their other aspects; and they are far more difficult and require delicate handling. It is easy to envisage the immediate effects, for instance, of limitation of stock, such as the starvation that will result from insufficient cultivation and the overburdening of the women with agricultural work; but when it is realized that the cattle are barely sufficient to maintain the *munywalo* exchanges upon which the social organization rests, one cannot venture to predict what the ultimate effect of limitation will be.

231 Goats are the animals *par excellence* of ritual and religious importance.
431 They also feature prominently in exchanges which promote social inter-relations, such as marriage exchanges and the goodwill gifts between relatives-in-law. Second only to beer in re-establishing relations that have become strained, they are used very largely in the procedure of reconciliation, of righting wrongs by begging pardon, and in the payment of judgement debts. When a distinguished guest visits you, you honour him by killing a goat for him; when you bring beer to your *vaguhulu*, the people to whom the daughters of your lineage are married, or even to a
